

JQUERY

Q1. Create a webpage which contains a button element.

1. Add a click event to the button tag which should alert a “hello world” message when the button is pressed.
2. Add a hover event to the button tag which will change the text of the button to “Hovered In” when the mouse hovers over the button.
3. Add a click event to the button which will remove the button from the document when clicked.

Q2. Create a webpage which will contain a table with 2 button tags each for a specific task, and one empty column which will be used as a counter.

The first button with the + (Plus) symbol will increase the counter and the other button with the -(minus) symbol decrease the counter by one;

<div>+</div>	1	<div>-</div>
--------------	---	--------------

Q3. Create a webpage which will contain a login form and a table as shown below, and when the login button is pressed, it will fetch the **Email** and **Password** from the login input elements and will display those on to the table.
